

## Exercise 14: Test

By: Rahul Sharma

July 9, 2018

The time has come the you take a test on the course that you have completed until today. It's been a long time that I have given a lecture on Python, so it is recommended that you go through the other lectures before you attempt the test.

In this test a python file is provided which has a lot of statements written in it. What you have to do is simply find the mistakes in the program. Some of the mistakes will be given by the python compiler as errors so they will be easy to find. However, some of the mistakes are logical mistakes, meaning if there is an incorrect formula written, then the python compiler will not show the error because it is not a syntax error.

Be sure that you go through the code several times before submitting the correct code. You have to submit the corrected code in a file called **ex\_14\_test\_submission.py**. This exercise has only this test and nothing else.

The file is attached in the Google Classroom exercise page.

*Note: The purpose of this test is to allow you to develop your debugging and code reading skills which is a very important tool for a programmer in his day to day life.*
